

10 — Live Link, Sample Users & Git Repository

This page provides the live demo link, one login per user type with passwords, and the Git repository link, as required.

Live application

The website URL is account-specific and is printed at the end of `redeploy_all.py` (format: `http://seatme-<account-id>.s3-website-us-east-1.amazonaws.com`). Paste your deployed URL here:

- **Live site:** `PASTE_LIVE_WEBSITE_URL_HERE`
- **Swagger UI (API):** open `backend/api/index.html` via a local server (see [../09-source-and-api](#)).
- **No-login demo (host) link:** `PASTE_LIVE_WEBSITE_URL_HERE/host.html?host=demo@seatme.app`

Git repository

- **Repository:** `PASTE_GIT_REPOSITORY_URL_HERE`

Sample users (one per permission group)

These users are **seeded automatically** by `backend/deploy/setup_cognito.py`. Change the passwords before any real use.

Role / group	Where to sign in	Email	Password
Admin (group <code>admin</code>)	<code>login.html</code> → routed to <code>admin.html</code>	<code>admin@seatme.app</code>	<code>12345678</code>
User / Host (group <code>host</code>)	<code>login.html</code> → routed to <code>host.html</code>	<code>demo@seatme.app</code>	<code>12345678</code>
Guest (no account)	personal RSVP link only	— (anonymous)	— (no password)

Notes

- The **Guest** role is unauthenticated by design — guests only ever use their personal RSVP link (`rsvp.html?...`), so there is no guest username/password.
- The seeded passwords can be overridden at deploy time with environment variables: `SEATME_ADMIN_PASSWORD`, `SEATME_HOST_PASSWORD` (and `SEATME_ADMIN_EMAIL`, `SEATME_HOST_EMAIL`).
- The **Host** demo user (`demo@seatme.app`) owns the seeded example event, so signing in as the host shows a populated dashboard. The **Admin** user has no event of its own and lands directly on the admin portal listing all events.

How to verify each role quickly

1. **Admin:** sign in with the admin credentials → you should land on the admin portal and see every event; click **Open** on any event to manage it.
2. **Host:** sign in with the host credentials → you should land on the populated event dashboard.
3. **Guest:** from the host dashboard, open a guest and copy their personal RSVP link (or use the seeded demo link), then open it in a private window — it should let you RSVP with no login.
